

RWAI:

“The world's first Real World Assets project that combines Artificial Intelligence and Finance”

ABSTRACT.

“Sustainable Income Model”

"Proof of Profit" is the world's first Real World Assets project that combines Artificial Intelligence and Finance, bringing a fresh perspective to the cryptocurrency world. It has been developed to solve a specific problem or provide unique benefits and aims to deliver real value to users by focusing on artificial intelligence.

The project revolves around the "Proof of Profit" consensus, which emphasizes functionality and efficiency, and aims to announce it to the entire blockchain ecosystem. It is the first project in the world based on the principle of evaluating the income generated through fees using artificial intelligence in token trading and conducting buybacks of the existing token.

If we examine this consensus at its core, it is the main product of integrating Artificial Intelligence and human expertise into the financial world through blockchain. Furthermore, our project is highly suitable for the term Real World Assets, which holds an important place in the blockchain. Real world assets generally have the potential to preserve their financial value while also generating income.

Technically, RWAI utilizes the Binance Smart Chain infrastructure and creates a unique ecosystem with its technological features. The RWAI token encourages users to contribute to the ecosystem by providing specific advantages or features.

Our project roadmap encompasses future stages and goals, aiming for sustainable growth. Led by experienced and passionate team members, our team is dedicatedly working towards the success of the project. We also have strategic partnerships that support the project.

Due to its unique structure, RWAI refuses to engage in continuous marketing efforts like other projects. This approach, stemming from its sustainable trading structure, is widely accepted by the entire ecosystem. Security and the protection of users' assets are a priority for RWAI. We are committed to providing users with a secure experience by implementing advanced security measures and mechanisms.

This summary provides readers with a general overview of our project's main objectives, technical features, security measures, and uniqueness, emphasizing its unique characteristics. For more detailed information, please refer to our White Paper.

Stage 1:

Collection of fees:

Fees are automatically collected at each transaction. There is no need for anything.

Stage 2:

Selection of investment products with the help of artificial intelligence:

The most reasonable selection is made with the assistance of artificial intelligence and human experience, and holders do not need to do anything.

Stage 3:

Investment is made, and an estimated maturity period is determined.

Stage 4:

Profit-taking and planning:

Profits are taken from the invested product, and the incoming funds are evaluated in the DAO-team partnership.

Stage 5:

Buyback:

Buybacks are conducted at the discretion of the DAO and the team, in the amount determined, and then burned.

“This organization is the financial outcome of the integration of artificial intelligence-human expertise, blockchain, and DAO-team circulation.”

Modelling:

1) Buy Fees:

Total volume x %10

2) Sell Fees:

Total volume x %10

3) $((\text{Buy Fees} + \text{Sell Fees}) \times 40) / 100 = \text{Cash for Trade}$

4) Cash for Trade:

x) Trade closed with profit;

Buyback and burn with compound earnings. Modeling continues as the circulation above.

y) It is necessary to stop at 10% loss and start a new trade.

Buyback and burn with compound earnings. Modeling continues as the circulation above.

Note: Fee settings and other rates can be changed with the joint decision of our team and DAO it.

Thanks to our flexible business model, we will be able to keep up with the new trends in the market immediately. We trust our blockchain team and community. We will keep our project constantly updated.

Basic Tokenomics:

No pre-sales done as we want to rise with our community.
Let's explain it simply without getting bogged down in confusing graphics:

Total Supply: 100.000.000 \$ RWAI TOKENS

%14 Liquidity,

%25 DAO,

%35 Amm,

%6 Team,

%20 Treasury.

*AMM wallet will constantly trade to keep trading active. Having a large volume is very important to us.
